

General Information: Potential Hazards
for
ANCILLARY PERSONNEL

The general hazards associated with contact with animals fall into three categories: zoonoses, allergies, and injuries.

ZOONOSES

Zoonoses are diseases of animals that are transmissible to humans. They may present significant hazard in some situations where animals are used. Fortunately, many laboratory animal species today are bred to be free of zoonoses that were once more common in these animals. However, laboratory and farm animals can be infected with zoonotic agents, some of which can be life-threatening to humans. Prevention of exposure to these animal-related illnesses requires knowledge of the zoonoses that may be found in the animals with which you may come into contact. If you are exposed through a bite, scratch, aerosol droplet, mucosal secretion, feces, or urine, there is the potential for you to become infected. You must notify your supervisor and seek medical consultation as quickly as possible.

You may be at increased risk for zoonotic infection if you are immune compromised (e.g. taking steroids such as prednisone on a regular basis, diabetic, infected with HIV, autoimmune diseases). If you have questions or concerns about your health status and risks that you may be exposed to, please make an appointment with your healthcare provider for a health evaluation and to address any questions.

The Hazard Analysis Tool located at <https://safetyservices.ucdavis.edu/units/ehs/research/laboratory/lhat> and the Public Health Agency of Canada at <http://www.phac-aspc.gc.ca/id-mi/index-eng.php> have websites that provide excellent resources regarding zoonotic diseases.

ALLERGIES

The incidence is quite high - some estimate that as many as 15% of people are allergic to some animal species. If you are allergic to a species that you have regular contact with, it can be debilitating. If you suffer from asthma, having contact with a species to which you are allergic presents a significant health risk.

Individuals with allergies may display any of a number of symptoms. These include allergic rhinitis (a condition characterized by runny nose and sneezing similar to hay fever); allergic conjunctivitis

(irritation and tearing of the eyes); asthma (characterized by wheezing and shortness of breath); and contact dermatitis (a red, bumpy rash that may appear). If you have a stuffy nose or other respiratory signs, and if it seems to last longer than a common cold (weeks instead of days) then you may be suffering from an allergy. If you develop suspicious symptoms whenever you are exposed to a particular species, then you may have an animal allergy.

People may be allergic to any animal species. The allergens are proteins that are excreted in the saliva, urine, and from various glands associated with the skin. The proteins tend to be sticky and become associated with the animal's hair and with particles of dander. The allergens are unique to each species of animal, thus it is possible to be allergic to mice and not to rats or vice versa. It is also possible to be allergic to multiple species.

The most effective way to control and prevent allergies is to minimize exposure to the allergens. If you have animal allergies, or think you are at risk of developing such allergies as a result of exposure to animals, you should make an appointment to discuss your concerns with a healthcare provider and obtain the necessary advice about the best methods you can use to protect yourself.

INJURIES

All animals are capable of inflicting bites and scratches. Small animals, such as rodents and rabbits, usually cause only minor wounds. Larger species like cats, dogs, and nonhuman primates can inflict severe wounds. Bite and scratch wounds can become infected due to the normal bacteria present in the animal's mouth or nails, or by bacteria that are present on your own skin.

If you are bitten, scratched, or otherwise injured (e.g. needle stick), immediately wash any wounds with soap and water, and immediately inform your supervisor about the injury. Call Occupational Health or your healthcare provider to help you make an informed decision regarding your medical needs.
